Founder. Operator. AI Systems Architect.

Jacob Maynard is a founder and AI systems architect with 10+ years of operations leadership. He translates operational complexity into software architecture — designing modular, deterministic systems that reduce manual overhead and preserve human control over high-stakes decisions.

Pulseforge is the expression of that work: an AI-native platform for workflow orchestration, operational intelligence, CRM automation, knowledge management, communications, reporting, and human-governed decision support.

The architecture is in production with Anchor Cleaning Company, validated against real operational demands — live data, real workflows, no controlled environment.

KEY ACHIEVEMENTS

A modular AI platform designed from operational first principles.

Pulseforge is the platform Jacob designed to prove the architecture works. Eight integrated capability layers share context, pass state, and surface only what humans need to act on — keeping automation deterministic and governance intact at every boundary.

PLATFORM DESIGN PHILOSOPHY

Modular —
each service

- is independently deployable

Deterministic

- predictable, auditable outputs

Observable — full

- visibility at every layer

Governed — humans

- approve before execution

Layered architecture. Governed at every boundary.

Pulseforge is organized as a stack of discrete layers, each with a clearly defined responsibility. Operators interact at the surface; AI processes at depth; humans govern at the boundaries that matter.

ARCHITECTURE PRINCIPLES

Each layer has one responsibility

Separation of concerns

State flows downward only

Unidirectional data

Human approval at exit points

Governed automation

Every decision is logged

Full auditability

Operator

User · Administrator · Service Manager

Interface Layer

Web App · Dashboard · API Surface

Six principles that govern every design decision.

These are not aspirations — they are constraints. Every component, workflow, and integration is measured against them before it ships.

● PRODUCTION VALIDATION

Anchor Cleaning Company

Anchor Cleaning is the first production deployment of the Pulseforge platform. A multi-service residential cleaning business, Anchor validated the full capability stack — from prospect intelligence through communications and reporting.

From operator to architect — a decade in the making.

The systems Jacob builds are grounded in real operational experience. Every design decision is informed by years of managing service operations before a line of Pulseforge was written.

Five decisions that define the Pulseforge architecture.

Each decision below was made deliberately, tested against real operational requirements, and validated in production. These are not defaults — they are commitments.

	RATIONALE	IMPACT
 Human Approval Layer	AI systems must not execute high-stakes decisions	<i>"Eliminates risk of costly"</i>

*I design software
that reduces
operational
burden.*

— Jacob Maynard · Founder, Pulseforge

DESIGN
COMPASS

- 1. Does the system reduce manual effort?
- 2. Can a human inspect this decision?
- 3. Does the system compose over time?
- 4. Can we remove this layer?

CORE TENETS

I Complexity is a tax.
Every

II Every manual step is a systems
